Through effort, communication and what the president calls female engineering, All American Air Filters has become a world-class electrostatic air filter manufacturer.

Begun in 1977 by current vice president's father, Bob Dargel, the Pompano Beach-based company wins hundreds of patrons each year with its self-charging, easy-to-clean air filter.

All American Air Filters are built to last 12-20 years and guaranteed for 10. The media is heavy-duty polypropylene, not the popular fiberglass, polyester or foam which degrades, and it's white so you can see when it's dirty. It's effective down to 0.3 microns and removes up to 88 percent of airborne particles. Solid aluminum or 100 percent polypropylene flexible frames are virtually indestructible.

"Many commercial applications require All American Air Filters to replace a bank of 10 to 20 filters with one or two customized panels." Says Bean. "The result is a dramatic increase in air flow and decrease in resistance."

Because there is no replacement costs and no operational costs, All American Air Filters pay for themselves in one or two years.

Last year, All American Air Filters tripled its facility size, doubled its volume and began work in Canada. This year the all-woman crew has work in Europe (where fiberglass is banned) New Zealand and South America.
